

Image Sensor

The Alarm.com Image Sensor is a breakthrough new product that combines a wireless PIR (Passive Infrared) motion sensor, an integrated still camera, completely wireless communication, and Alarm.com Interactive Services. The Alarm.com Image Sensor offers an entirely new service to the customer designed to deliver better security through visual verification of alarms and increased engagement through on-demand property views.

The Alarm.com Image Sensor is simple to install—no wires to run for setup, power or signal communication. It uses the dedicated wireless connection of the Alarm.com system so there is no need to connect to a router. Its integrated camera with infrared LED flash captures images when motion is sensed. Convenient wall mounts allow for corner or flat wall mounting at a variety of angles so it's easy to place in any room to capture snapshots of activity day or night.

The Alarm.com Image Sensor is integrated with Alarm.com Interactive Services, so images are easily accessible to customers. All uploaded images are viewable on the Alarm.com Customer Website or through the mobile apps. Customers can even receive images in text or email alerts when an image is uploaded. This increases security by letting customers see what is going on, reduces false alarms with customer verification and increases stickiness by allowing on-demand peek-in access to the property.

Exclusive Alarm.com product

Motion sensor, image capture and interactive services in one

Simple to install and service

No broadband or router needed

Increases customer engagement

Mobile and web access

Offer the latest technology in a smart, easy to use and affordable package.

Breakthrough Combination of Product & Service
